

The Materials

During the years the company specialized in molding ***cold forged aluminum***:

- A great conductor of heat: aluminum reaches high temperatures quicker than cast iron, iron and stainless steel cookware, and redistributes heat homogeneously
- Aluminum is lightweight and therefore manageable
- It's easy to recycle
- Aluminum forging is «cold» which avoids the dispersion of dangerous substances in the environment
- Finally, processing of cold forged aluminum is the best option to guarantee a high level of purity of the metal – up to 98% of certified purity – and therefore higher safety for the consumer health.
